

RESTHRU

Restaurant Management System

System Documentation

User Roles · Panels · Page Status · Feature Map · Recommendations

Version 1.0 · July 2026

Made in Nepal, for Nepal

1. System Overview & User Roles

RESTHRU is a complete restaurant management platform. It has five kinds of users, each with their own panel (screen area) and login.

1.1 The Five User Roles

Role	Panel / URL	Who they are	What they do
Super Admin	/superadmin	Platform operator (RESTHRU company)	Manages all restaurants, subscriptions, packages, platform health
Owner	/owner	Restaurant owner / manager	Menu, staff, inventory, reports, logs, settings
Reception	/reception	Receptionist / cashier	Front desk, billing, orders, tables, kitchen, shifts, CRM
Waiter	/order	Serving staff	Takes orders at the table on a phone/tablet
Customer	Public site + QR	Restaurant guests & visitors	Views menu by QR, places orders from the table, requests bill

1.2 How Each Role Logs In

- Super Admin — separate login at /superadmin/login.
- Owner — logs in at /owner/login (or via the main site's Login button).
- Reception — login accounts are created by the Owner in Staff Management; log in via the site login.
- Waiter — login accounts created by the Owner; logs in at /order/login.
- Customer — no login needed. Scans the QR code on the table or visits the website.

1.3 Shared Safety Features (all staff panels)

- Idle timeout — warns after 4 minutes of inactivity, signs out at 5 minutes (protects unattended terminals).
- Manager approval — voiding a bill, order, or item requires a manager/owner to type their own username and password.
- Offline support — staff panels keep working when the wifi drops and sync when back online (offline banner + sync indicator).
- Activity logging — sensitive actions (voids, cash drawer opens, shift open/close) are written to an audit log the Owner can read.

2. Super Admin Panel (/superadmin)

Internal tool for the RESTHRU platform team. 13 sidebar pages. Status: consistent design, most core flows working; several advanced tools are honestly marked “coming soon” instead of showing fake buttons.

2.1 Sidebar Pages & Buttons

- **Dashboard** — platform KPIs (restaurants, revenue, growth) at a glance.
- **Restaurants** — list of every registered restaurant; open one to see details, plan, tables, menu size. Documents tab is marked coming soon.
- **Subscriptions** — view/manage restaurant subscriptions; promo-code search works on real data.
- **Analytics** — platform-wide charts; Export Report button wired.
- **Support Center** — support tickets view; Mass Communication form (send message to owners) fully working; Knowledge Base marked coming soon.
- **System Health** — service status toggles, alert channels saved to the server.
- **Sales Pipeline** — trial/lead tracking; trial filter works; “Menu Added” indicator uses real menu counts.
- **Marketing Tools** — CMS content tabs filter real content; A/B testing marked coming soon.
- **Compliance** — overview page; Document Vault, Fraud Detection and Data Export marked coming soon.
- **Financials** — platform revenue and payouts view.
- **Innovation Lab** — idea board; Generate PDF wired; experiment tracking / roadmap voting marked coming soon.
- **Manage Package** — create/edit the subscription plans (Free / paid) with limits for tables, staff and menu items — these limits are enforced in the Owner panel.
- **Settings** — IP whitelist, session timeout, and API key copy/reveal/regenerate all work; 2FA and Backup/Restore are disabled with an explanatory tooltip.

2.2 Present Status Summary

- Working: restaurant management, packages/plans, promo codes, mass communication, API keys, health settings.
- Marked as coming soon (no fake buttons): document vault, fraud detection, A/B testing, knowledge base, experiment tracking, 2FA, backup/restore.
- Note: the public status page numbers are illustrative samples, not a live monitoring feed.

3. Owner Panel (/owner)

The owner's control center. 8 sidebar pages plus a QR-codes page. All main flows work with real data.

3.1 Dashboard (sidebar button 1)

- KPI cards: Today's Revenue, Total Orders, Active Tables, Pending Orders — live numbers.
- Revenue chart with This Week / This Month toggle.
- Top Items list (best sellers with order counts and revenue).
- Table Overview grid — numbered tables colored by status (available / occupied / reserved).
- Live Orders list and Recent Activity feed (orders placed, bills paid).

3.2 Orders (button 2)

- All Orders view — every order with items, table, amount, and status.
- Advance an order's status or cancel it (with confirmation dialog).

3.3 Menu Management (button 3)

- Add / edit / delete categories and menu items — delete asks for confirmation.
- Item form is split into clear sections: basics, pricing, dietary info, add-ons.
- Availability toggle per item; bulk actions for price changes and bulk availability.
- Working QR-code generator for the public menu.

3.4 Staff Management (button 4)

- Staff directory — add staff with photo, role, salary, ID documents, emergency contact.
- Create Reception logins and Waiter logins; each staff row shows whether a login exists.
- Staff detail view shows real information (fake “today's activity” was removed).

3.5 Inventory (button 5)

- Stock list with quantity, reorder level, supplier and health status.
- Inline stock editing saves to the server; stock history per item.
- Low-stock alerts surface on the dashboard.

3.6 Reports & Analytics (button 6)

- Four tabs, all on real data: Sales, Items, Staff, Tax & VAT.
- Date filters: Today / Week / Month / Custom — all working.
- Export CSV and Download IRD-format report buttons work.

3.7 Logs (button 7)

- Audit trail: total logs and today's activity KPIs, plus the searchable list.
- Shows voids, cash-drawer opens, shift open/close, and who did each action.

3.8 Settings (button 8)

- Restaurant profile, opening hours, billing & tax (tax-rate list with a clear default).
- Printers tab with visible editable fields; per-tab Save with unsaved-changes warning.
- Subscription section — Cancel Subscription asks for confirmation.

3.9 QR Codes page

- Real QR codes for the restaurant's actual tables; Download / Print / Apply-to-All work.

4. Reception Panel (/reception)

The busiest panel — the front-of-house and cashier workstation. 12 sidebar pages. Built for speed: big touch targets and keyboard shortcuts on the money screens.

4.1 Front Desk (home page)

- Reservations tab — create a reservation, check a guest in, cancel (with confirmation).
- Floor & Walk-in tab — visual floor grid by floor; assign a walk-in guest to a table in about 3 clicks.
- Waitlist tab — add guest with quoted wait, Notify, Seat (with table picker), Remove (confirmed).
- Merge / Split tab — combine two tables' orders or move items to another table.

4.2 Live Orders

- Kanban board by status: Pending → Preparing → Ready → Served (+ Cancelled).
- One-tap advance status; quick Pay and Void directly on the order card.
- Void order / void single item requires manager approval (username + password).
- Sound alert for new orders; proper loading skeletons.

4.3 Invoices

- Search bills by bill number, order number, or customer name/phone.
- Filter by status (Pending / Held / Paid / Void) and date range.
- Open a bill → Reprint receipt or Void (manager approval + reason, kept in the audit log).

4.4 Table Map

- Drag tables to rearrange the floor plan (edit mode) — save confirmation shown.
- One-tap status change buttons; add and remove tables.

4.5 Checkout (the cashier screen)

- Pick a pending bill → take payment in multiple parts (Cash, eSewa, Khalti, FonePay) until paid.
- Change calculator with quick-tender note buttons; running balance due.
- Split a bill equally N ways.
- Adjustments panel: discount, coupon code, or corporate account — in one place.
- QR wallet payment: generate QR, live verify status with visible progress.
- Park (hold) a bill and resume it later — survives a page reload.
- Cash drawer open button — every press is logged for audit.
- Print receipt; keyboard shortcuts for Pay / Park / Print; confirmation before settling.

4.6 Order (built-in POS)

- Same order-taking screen as the waiter app, for taking orders at the counter.

4.7 Kitchen Display

- Orders appear oldest-first; tick off items as cooked, or “mark all” at once.
- Start Cooking → Ready → Served buttons with Undo; new-order sound alert.
- Multi-column layout on wide kitchen screens; matches the app's design theme.

4.8 Print Center

- Printer list with manually-set status (honest — no fake “online” indicators).
- Print settings toggles; Queue and History clearly marked as not available yet.

4.9 CRM

- Customers — live search, profiles with dietary notes, loyalty points add and redeem.
- Coupons — create with validity window and usage limit; deactivating asks for confirmation.
- Corporate accounts — company billing profiles used at checkout.

4.10 Inventory

- Same stock view as the Owner's, so reception can update stock counts.

4.11 Shifts

- Open Shift — choose the staff member on the register and declare the starting cash float.
- Active shift cards show elapsed time and float; Close & Reconcile compares expected cash vs counted cash and records any discrepancy.
- Shift history table with per-shift summary: sales by payment method, bills settled, average ticket, void count.

5. Waiter App (/order)

A phone/tablet screen for serving staff. Simple by design — take the order, send it to the kitchen.

5.1 Screens & Buttons

- Login — waiter signs in with the account the Owner created.
- Table selector — pick the table (and guest count) before ordering.
- Menu grid — items by category with photos and prices; tap to add, +/- to change quantity.
- Item options — long-press an item for add-ons and notes (a visible hint shows this gesture exists); modifiers come from the item's real configured add-ons.
- Cart (order sheet) — review items, edit quantities per line, add notes, then Place Order → goes straight to the Kitchen Display.
- Active orders — see the status of orders they placed; food-ready notifications; cancel asks for confirmation.

5.2 Present Status

- Fully working end-to-end: an order placed here appears in Kitchen Display and Live Orders instantly.
- Prices display in the restaurant's currency (Rs) everywhere.
- Matches the app theme, including dark mode.

6. Customer / Public Pages

6.1 Marketing Website (no login)

- Home page — hero, features, how-it-works, pricing preview, testimonials, FAQ, call-to-action.
- Start Free Trial → register page creates the restaurant account (owner name, restaurant, plan).
- Contact form — real validated submission (not a fake success message).
- Pricing, About, Blog, Careers, Help (with working FAQ search), Docs, legal pages.
- Honesty fixes: dead “Read more” links removed; API page marked “planned”; status page marked illustrative.

6.2 QR Menu Book (/r/[restaurant])

- Browse-only flip-book style menu — what a guest sees scanning the general QR code.
- Friendly error screen with Try Again if the restaurant link is wrong.

6.3 QR Table Ordering (/r/[restaurant]/t/[table]) — the key customer flow

- Guest scans the QR sticker on their table — no app, no login.
- Browses the live menu, adds items to a cart with quantities and notes.
- Place Order — creates a real order: prices are checked on the server, the table is marked occupied, and staff get a notification.
- Live 4-step order tracker (Placed → Preparing → Ready → Served) that updates every few seconds, showing the real order number.
- Request Bill — choose payment method (and split count); staff are notified at the counter.
- Digital wallet payments show a real scannable QR code.
- Link to the flip-book menu for browsing.

7. How Features Connect

The system is one pipeline — every panel feeds the next. The most important links:

7.1 The Order Pipeline (the spine of the system)

- Order sources: Customer QR table → / Waiter app → / Reception POS → all create the same kind of order.
- Every order → Kitchen Display (cooking) → Live Orders (front desk tracking) → Checkout (bill & payment) → Invoices (history/reprint/void) → Reports and Logs.

7.2 Money & Accountability

- Checkout payments feed the Shift screen — cash payments during a shift decide the “expected cash” at reconciliation.
- Every void (bill, order, item) needs Manager Approval, and every approval is written to the Owner's Logs.
- Reports (Sales / Tax & VAT tabs) are built from the same bills and payments Checkout creates.

7.3 Menu, Tables & People

- Menu Management is the single source for: waiter menu grid, customer QR menus, checkout quick-keys, and reports' item rankings.
- Table Map status is shared by Front Desk (walk-in / reservations / waitlist seat a guest → table becomes occupied) and by orders (settling the bill frees the table).
- Staff Management roster feeds Shift opening (choosing who's on the register) and the Reception/Waiter login accounts.
- CRM feeds Checkout — loyalty points, coupons, and corporate accounts are applied in the Adjustments panel.

7.4 Platform Level

- Super Admin's Manage Package plan limits (tables / staff / menu items) are enforced inside the Owner panel.
- Registration on the public site creates the restaurant the Owner then manages.

8. Recommendations vs. an Ideal Restaurant System

Comparison of RESTHRU today against a full-featured ideal restaurant management system, with recommendations per panel. Priority: H = high, M = medium, L = low.

8.1 Comparison Table

Area	RESTHRU today	Ideal system	Gap / Priority
Ordering (QR/waiter/POS)	Fully working, 3 sources, live tracking	Same + course firing, seat-level items	Small / M
Billing & payments	Multi-tender, split, QR wallets (manual verify)	Auto-verified gateway payments, tips	Gateway auto-verify / H
Kitchen	Live display, sounds, bulk actions	Station routing (bar vs kitchen), prep-time analytics	Medium / M
Inventory	Manual stock counts + alerts	Auto-deduct from recipes per order, purchase orders, supplier mgmt	Large / H
Staff	Roster, logins, shifts + cash reconciliation	Rotas/scheduling, attendance, payroll export	Medium / M
CRM & loyalty	Profiles, points, coupons, corporate	Tiers, birthday offers, SMS/email campaigns	Medium / M
Reports	Sales/items/staff/tax, CSV + IRD export	Forecasting, profit margins (needs recipe costs)	Medium / M
Reservations	Book, check-in, waitlist + notify	Online booking page, deposits, SMS reminders	Medium / M
Hardware	Browser printing; printer list is manual	Direct thermal printer, cash drawer, barcode support	Large / H
Multi-outlet	One restaurant per owner account	Chains: many outlets, one owner view	Large / L
Platform (super admin)	Plans, promo codes, comms working	Real uptime monitoring, automated billing, 2FA	Medium / M

8.2 Recommendations by Panel

Owner panel

- Highest value: recipe-based inventory — link menu items to ingredients so stock deducts automatically with each order; today all stock changes are manual.
- Add purchase orders and supplier records so reordering happens inside the system.
- Add staff scheduling (rotas) and attendance on top of the existing shift records.
- Use recipe costs to show profit per dish in Reports, not just revenue.

Reception panel

- Integrate a real payment gateway so eSewa/Khalti payments verify automatically instead of the cashier confirming; this also unlocks customer pay-at-table.
- Add split-by-item billing (currently equal splits only) and a tips field at checkout.
- Direct thermal-printer support (print without the browser dialog) and a real print queue.
- SMS reminders for reservations and waitlist (the notify button currently creates an in-app notification only).

Kitchen & Waiter

- Route drink items to a bar screen and food to the kitchen screen separately.
- Course control for waiters — hold desserts, fire starters first.
- Track promised vs actual preparation time to spot kitchen bottlenecks.

Customer experience

- Let guests pay online right from the QR page once a gateway exists — the single biggest guest-facing upgrade.
- Loyalty sign-up from the QR page (phone number) so points collect automatically.
- Nepali language toggle for the menu — removed earlier because no translations existed; worth building properly.
- Order-ahead / takeaway ordering from home, and later delivery-partner integration.

Super Admin

- Replace the illustrative status page with real uptime monitoring.
- Automate subscription billing and renewals; enable real 2FA and backups (currently disabled placeholders).

8.3 Suggested Priority Order

1. Payment gateway with auto-verification (unlocks checkout speed + customer pay-at-table).
2. Recipe-based inventory auto-deduction (turns inventory from a checklist into a control system).
3. Thermal printer integration (removes the browser print dialog from every receipt).
4. SMS for reservations/waitlist, then scheduling/attendance, then multi-outlet.

Overall: RESTHRU already covers the full daily loop of a restaurant — order → kitchen → bill → cash-up → reports — with honest UI (no fake buttons). The gaps are integrations (payments, printers, SMS) and automation (inventory, scheduling), not missing core workflow.
